GA4 101 Micro-Application: Measurement Inventory

Training Completion

GA4 “Get Started” Module Completion

Context

Property Used: Google Merchandise Store demo account

For this assignment I explored the Google Merchandise Store demo property inside Google Analytics 4. The goal was to understand how GA4 organizes data collection and what kinds of user activity are automatically tracked on a website.

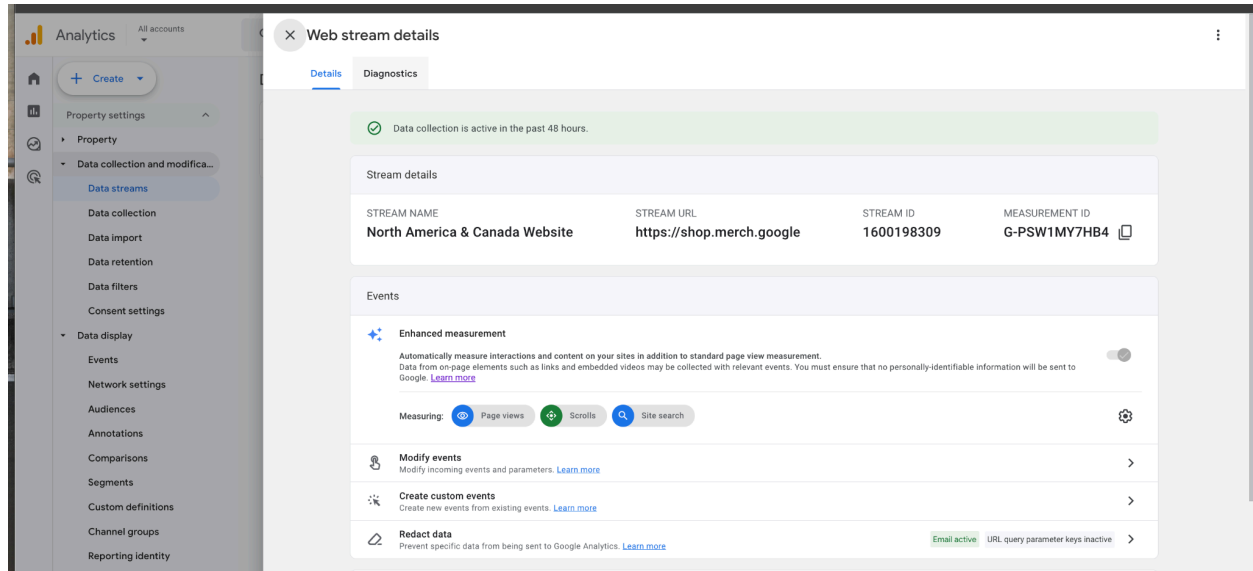

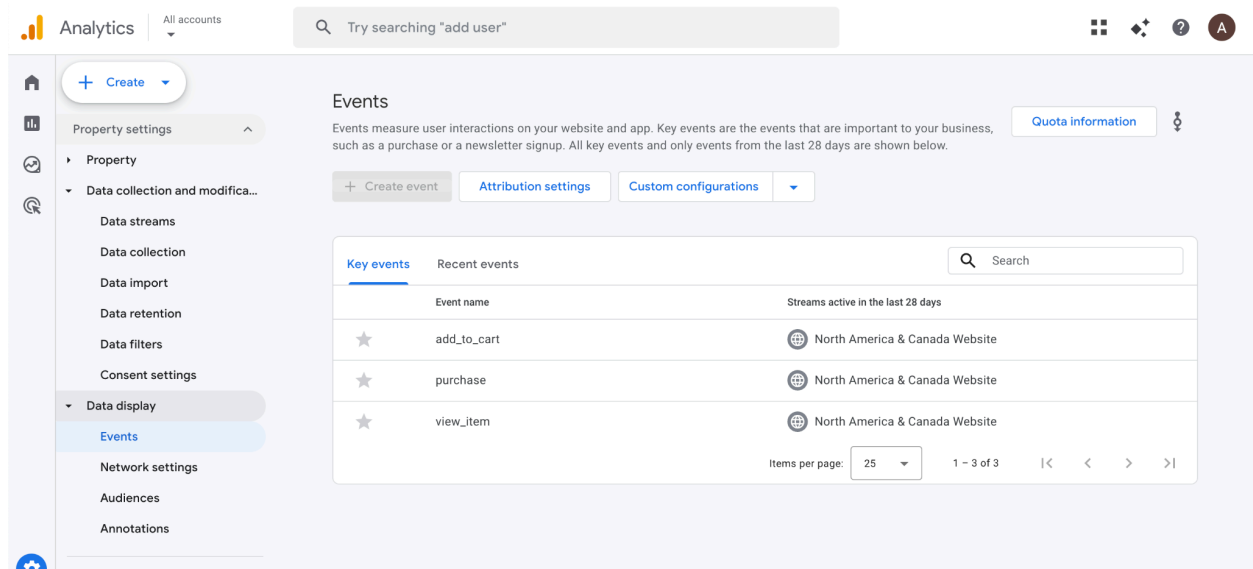

Figure 2 — Events

Short Responses

Account vs Property vs Data Stream

In GA4 the account is basically the top-level container for a company or organization. Inside the account are properties, which represent individual websites or apps being measured. Each property then contains data streams, which are the actual sources sending interaction data into Analytics (for example a website stream or mobile app stream). So the account is the business, the property is a specific digital platform, and the data stream is where the user activity actually comes from.

Three Important Events Observed

- **view_item** – shows when a user looks at a product, which helps measure interest
- **add_to_cart** – indicates intent to purchase and product engagement
- **purchase** – confirms a completed transaction and revenue

These three events together represent the shopping funnel from browsing → consideration → conversion.

Two Measurement Gaps or Opportunities

- **Limited engagement detail:** The property tracks page views but doesn't clearly show how far users interact with content. More engagement metrics (like deeper interaction or behavior patterns) would help evaluate page effectiveness.
- **Pre-purchase behavior:** There is no clear tracking for hesitation actions (for example removing items or backing out before checkout). Tracking those behaviors could help identify where users drop off and improve conversion rates.

Closing Note

Overall, GA4 automatically tracks useful behavioral data, especially for ecommerce actions. However, adding more detailed interaction tracking would make it easier to understand why users do or do not complete purchases.
